## 1. NAME OF THE MEDICINAL PRODUCT

Medicinal Air, Air Liquide 100\%, medicinal gas, compressed.

## 2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Medicinal air $100 \%$ at a pressure of 200 bar $\left(15^{\circ} \mathrm{C}\right)$.

## 3. PHARMACEUTICAL FORM

Medicinal gas, compressed

## 4. CLINICAL PARTICULARS

### 4.1 Therapeutic indications

Medicinal air is indicated as a replacement for normal environmental/room air whenever it is required, e.g.:

- In cases of respirator treatment or in connection with anaesthesia as a part of the fresh gas flow in order to give a gas mixture with the desired oxygen content $\left(\mathrm{FiO}_{2}\right)$
- As propellant in nebulisation treatment
- As pure air in the care of immunosuppressed patients such as in cases of organ/cell transplantation or extensive burn wounds.

### 4.2 Posology and method of administration

## Posology

Medicinal air can be used in children, adults and elderly. The purpose of using medicinal air is to ensure reliable administration of gas which contains oxygen in a concentration that corresponds to the normal air in the environment/room air without the risk of mixing in odours or other potentially irritating substances. Medicinal air is only indicated as a replacement/substitute for room air, and as soon as it is required it should be mixed with medicinal oxygen so that the desired oxygen concentration is obtained, using the calculation:
$\mathrm{FiO}_{2}=[($ number of litres of air/minute x 21) + (number of litres of oxygen/minute x 100] / (number of litres of air/minute + number of litres of oxygen/minute)

Method of administration
Medicinal air is administered via the inspiratory air.
Medicinal air is given via special equipment. With the aid of this equipment medicinal air is added to the gas that is to be inspired, and on expiration the air that has not been absorbed is mixed with the surrounding air (non-rebreathing system). In anaesthesia particularly, special equipment is often used which allows a greater or lesser proportion of the exhaled gas to be recirculated in the respiratory system and rebreathed (so-called rebreathing system).

For information on use and handling, see section 6.6

### 4.3 Contraindications

None known.

### 4.4 Special warnings and precautions for use

None known.

### 4.5 Interaction with other medicinal products and other forms of interaction

No known interactions.

### 4.6 Fertility, pregnancy and lactation

Medicinal air may be used during pregnancy and lactation.

### 4.7 Effects on ability to drive and use machines

Not relevant.

### 4.8 Undesirable effects

Not relevant.
Reporting of suspected adverse reactions.
Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions via the national reporting system. $<$ To be completed nationally>

### 4.9 Overdose

Not relevant.

## 5. PHARMACOLOGICAL PROPERTIES

### 5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Medical gases, ATC code V03AN05
Medicinal air contains $21 \%$ oxygen and the remaining part is nitrogen gas, which must be considered inert. Medicinal air is mainly used on account of its oxygen content, which corresponds completely to room air.

Oxygen is vital for human life, and must be supplied continually to all tissues in order to maintain the cells' energy production. Its target is the mitochondria in the individual cells, where the oxygen takes part in an enzymatic chain reaction, which creates energy, aerobic metabolism.

Nitrogen may be considered as inert.

### 5.2 Pharmacokinetic properties

Medicinal air consists of $21 \%$ oxygen, which corresponds completely to the concentration in normal room air/surrounding air. It is administered by inhalation and it is transported via the airways to the lungs. In the pulmonary alveoli, as a result of the difference in partial pressure, a gas exchange takes place from the inspired air/gas mixture to the capillary blood. The oxygen is transported further with the systemic circulation, for the most part bound to haemoglobin and only a very small part is freely dissolved in plasma, to the capillary beds in the different tissues of the body. The oxygen is transported with the aid of the pressure gradient out to the various cells.

Oxygen that is absorbed in the body is excreted almost completely as carbon dioxide formed in the intermediate metabolism.

Nitrogen is not absorbed. It follows the expiratory air without having undergone any conversion/metabolism.

### 5.3 Preclinical safety data

Not applicable.

## 6. PHARMACEUTICAL PARTICULARS

### 6.1 List of excipients

None.

### 6.2 Incompatibilities

Not applicable.

### 6.3 Shelf life

3 years

### 6.4 Special precautions for storage

Store the cylinder in a place reserved for medicinal gases (does not apply to the home care environment). Handle carefully. Ensure that the gas cylinders are not dropped or exposed to knocks.
Must be stored and transported with valves closed and, where these are present, with the protective valve cover/cap in place.

### 6.5 Nature and contents of container

The shoulder of the gas cylinder is marked with black and white paint (air). The body of the gas cylinder is white (medicinal gas).

Containers (incl. material) and valves:

1 litre steel gas cylinder with shut-off valve
1 litre aluminium gas cylinder with shut-off valve
2 litre steel gas cylinder with shut-off valve
2 litre aluminium gas cylinder with shut-off valve
2.5 litre steel gas cylinder with shut-off valve

2,5 litre aluminium gas cylinder with shut-off valve
2.5 litre steel gas cylinder with shut-off valve with Pin index
2.5 litre steel gas cylinder with shut-off valve and integrated pressure regulator

4 litre steel gas cylinder with shut-off valve
4 litre steel gas cylinder with shut-off valve with Pin index
5 litre steel gas cylinder with shut-off valve
5 litre aluminium gas cylinder with shut-off valve
5 litre aluminium gas cylinder with shut-off valve with integrated pressure regulator
10 litre steel gas cylinder with shut-off valve
10 litre aluminium gas cylinder with shut-off valve
20 litre steel gas cylinder with shut-off valve
20 litre aluminium gas cylinder with shut-off valve
40 litre steel gas cylinder with shut-off valve
50 litre steel gas cylinder with shut-off valve
50 litre aluminium gas cylinder with shut-off valve
$10 \times 50$ litre steel gas cylinders with shut-off valve
$12 \times 50$ litre steel gas cylinders with shut-off valve
$15 \times 40$ litre steel gas cylinders with shut-off valve
Not all pack sizes may be marketed
Gas cylinders/bundle filled to 200 bar deliver approx. $\mathrm{X} \mathrm{m}^{3}$ of gas at atmospheric pressure and $15^{\circ} \mathrm{C}$ according to the table below:

| Cylinder size in litres | 1 | 2 | 2.5 | 4 | 5 | 10 | 20 | 40 | 50 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Gas $\left(\mathrm{m}^{3}\right)$ | 0.2 | 0.4 | 0.5 | 0.8 | 1.0 | 2.0 | 4.0 | 8.0 | 9.9 |

| Bundle size in litres | $10 \times 50$ | $12 \times 50$ | $15 \times 40$ |
| :--- | :---: | :---: | :---: |
| Gas $\left(\mathrm{m}^{3}\right)$ | $1.0 \times 10^{2}$ | $1.2 \times 10^{2}$ | $1.2 \times 10^{2}$ |

Not all pack sizes may be marketed

### 6.6 Special precautions for disposal and other handling

## Instructions for use and handling

## General

Medicinal gases must only be used for medical purposes.
Different gas types and gas qualities must be kept separate from each other. Full and empty gas cylinders must be stored separately.

Never use oil or grease, even if the cylinder valve is stiff or if the regulator is difficult to connect. Handle valves and equipment to match with clean and grease-free (hand cream, etc.) hands.

Use only standard equipment that is intended for medicinal air.
The gas cylinders must be stored protected from wind and weather, and kept dry and clean.
Check that the cylinders are sealed before use.
Preparation for use

Remove the seal from the valve before use.

Use only regulators intended for medicinal air. Check that the connection on the outside of the coupling or regulator is clean and that the connections are in good condition.

Never use a tool on a stuck pressure/flow regulator intended to be connected manually, as this can damage the coupling.

Open the cylinder valve slowly - at least half a turn. Do not try to deal with leakage from the valve or apparatus yourself other than by changing the gasket or O-ring.

In the event of leakage, close the valve and uncouple the regulator. Label defective cylinders, put in the place intended for complaints and return them to the supplier.

Using the gas cylinder
Smoking and open flames are forbidden in rooms where medicinal air is being used. Close down the apparatus in the event of fire or if it is not being used.

Larger gas cylinders should be transported with an appropriate type of cylinder cart. Be especially careful that connected apparatus is not inadvertently loosened.

When the cylinder is in use it must be fixed in a suitable support.
When a small amount of gas is left in the gas cylinder, the cylinder valve must be closed. It is important to leave a little pressure in the cylinder to protect it from contamination.

After use, the cylinder valve must be closed hand-tight. Depressurise the regulator or connection.

## 7. MARKETING AUTHORISATION HOLDER

<To be completed nationally>

## 8. MARKETING AUTHORISATION NUMBER(S)

$<$ To be completed nationally>

## 9. DATE OF FIRST AUTHORISATION/RENEWAL OF THE AUTHORISATION

2009-05-08
